# Manually Test for RunContinuous() Method
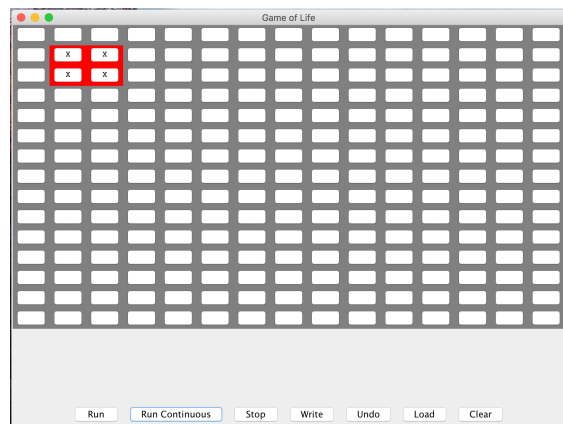

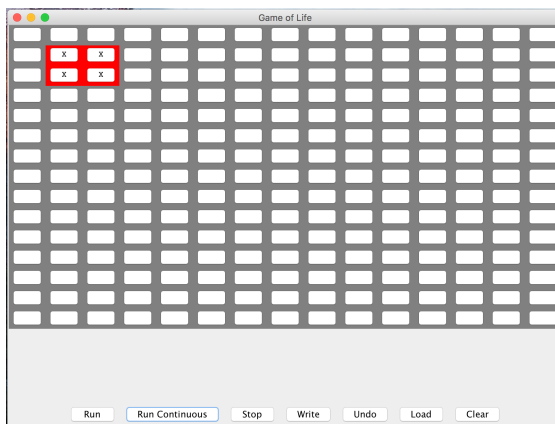

Procedure: open the application, choose cells, then press Run continuous button before refactor the runContinuous() method. Then do the same process(choose the same location cells) with the application after refactor the runContinuous() method. Compare the results of each case.

Case 1: when all the cell dead after run continuous

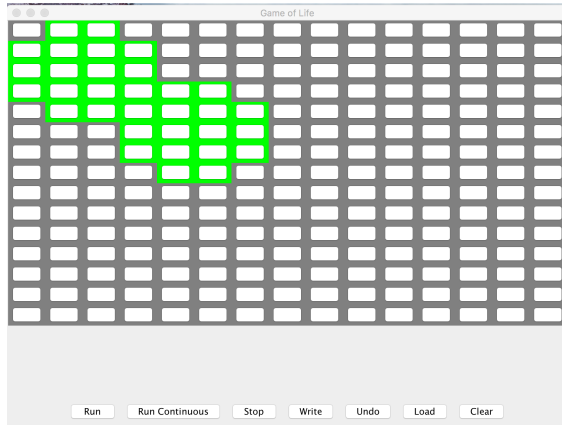

| **Before refactor**	**After refactor**

Case 2: when all cells lived after run continuous

**Before refactor**   **After refactor**

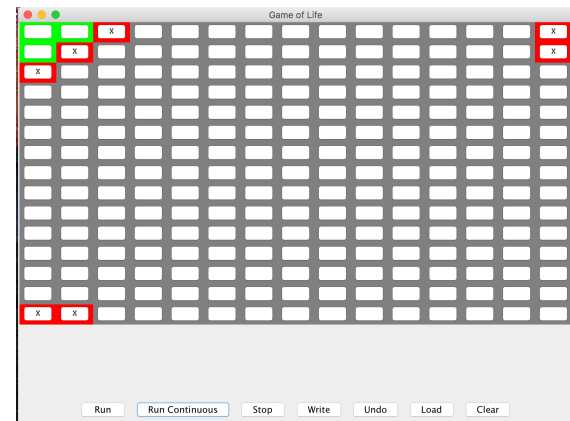

Case 3: when the cell either lived or dead after run continuous

Before refactor   **after refactor**

From the results, we can see that after refactor runContinuous() method, the function did not change.
